                                                                                                                                                                                                                                   suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ADB45601;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleotides. The nucleotides are used as probes or primers for detecting identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2003-441574/41.

A sequence that hybridizes under stringent conditions with CC identifying, quantifying and/or amplifying nucleic acids, as in vitro CC sense and antisense sequences, of nucleotides involved in tumour CC suppression or reversion, apoptosis and or viral resistance, to produce crecombinant polypeptides, and to prepare transgenic animals, as cells containing the vectors), the encoded polypeptides and antibodies (Also vectors containing them and CC (Ab) against the polypeptide are useful for prevention and/or treatment CC of viral infections or diseases characterized by development of tumours CC analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can CC analysis of the expression of the nucleotides can be used for diagnosis CC experimentally useful for treating diseases associated with abnormal CC expression of the nucleotides and polypeptides can CC expression of the nucleotides and polypeptides can CC expression of the nucleotides.

The composition has anoractic, antiarteriosclerotic, cardiant and antidiabetic properties. The invention is used to detect and treat conditions associated with elevated cholesterol and lipid or during adipogenesis, particularly obesity, athersclerosis, diabetes mellitus or coronary artery heart disease. This sequence represents a polynucleotide differentially expressed during cholesterol homeostasis and adipogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     obesity; athersclerosis; diabetes mellitus; coronary artery heart disease; cholesterol homeostasis; ss; differntial expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polynucleotides differentially regulated in response to cholesterol and adipogenesis are useful to detect and treat associated conditions such obesity, athersclerosis, diabetes mellitus and coronary artery heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cholesterol homeostasis/adipogenesis related DNA seq id

The composition has anorectic, antiarteriosclerotic, cardiant and antidiabetic properties. The invention is used to detect and treat conditions associated with elevated cholesterol and lipid or during adipogenesis, particularly obesity, athersclerosis, diabetes mellitus or coronary artery heart disease. This sequence represents a polynucleotide differentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polynucleotides differentially regulated in response to cholesterol addipogenesis are useful to detect and treat associated conditions supposity, athersclerosis, diabetes mellitus and coronary artery heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 08-JAN-2003; 2003US-00339793.
                    Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 8;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC cell, and the sample is metaphase spreads, interphase nucleic cell, and the sample is metaphase spreads, interphase nucleic or nucleic crown in paraffin embedded tissue material or frozen tissue sections. The CC probe is also useful in comparing a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid reference array. CC metaphase in the sample control genomic nucleic acid, which are differentially labelled, the crontrol genomic nucleic acid and control genomic nucleic acid and the array with the mixture of the probe under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid and the array to that caused by hybridization of the probes to genomic nucleic acid, thus comparing the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus compared with the relative copy numbers of sequences in the control sample as compared with the relative copy numbers of substantially claim is dequenced using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybridization of the genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable mothety such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable mothety such that hybridization conduction of the genomic array is determined by determining the presence from the control array. The genomic array comprises nucleic acid that is prepared from CC arrays. The genomic array comprises nucleic acid that is prepared from CC arrays. The genomic array comprises nucleic acid that is prepared from CC arrays. The genomic array comprises nucleic acid that is prepared from CC arrays.

The probe is useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or more detectable nucleic acid probes to the target genomic nucleic acid of the sample by determining the hybridization of the card of the sample. The genomic nucleic acid is contained in a fixed tissue or a first the contact of the sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to novel isolated nucleic acid sequences involved companies in the phenomena of tumour suppression, tumour reversion, apoptosis component of compounds with a cytostatic, virucide, neuroprotective, conctropic or neuroleptic activity. The DNA sequences may be useful as component of compounds with a cytostatic, virucide, neuroprotective, component of a primers for detecting, indentifying, quantifying and/or component of a gene chip, in contropic or neuroleptic activity. The DNA sequences may be useful as component of a gene chip, in contropic as antisense reagents and for production of recombinant contropic as antisense reagents and for production of recombinant contropic prevention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that care characterised by development of tumours or cell degeneration. The constitution of the prevention contropic contropic prevention. The sequence is that of a nucleic acid sequence of the invention. Sequence is that of a nucleic acid sequence of the printed contropic contropic printed that of a nucleic acid sequence of the invention. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, percifically cancer but also Alzheimer's disease and schizophrenia. The precifically cancer but also Alzheimer's disease and schizophrenia. The precification, but was obtained in electronic format directly from WIPO appecification, but was obtained in electronic format directly from WIPO
             This invention relates to novel isolated nucleic acid sequences involved in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               with tumors and and transfected

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
This invention relates to novel isolated nucleic acid sequences involved in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                                                                                                                                                                                                              New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                              Telerman
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic; virucide; neuroprotective; nootropic; neuroleptic;

                                                                                           This invention relates to novel isolated nucleic acid sequences involved in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or camplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant conjugations of the invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, are characterised by development of tumours or cell degeneration. The greent sequence is that of a nucleic acid sequence of the invention.

CC Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO or tertion into intrinsical contents and compare sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

in the phenomena of tumour suppression, tumour reversion, apoptosis cand/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, comotropic or neuroleptic activity. The DNA sequences may be useful as cytobes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant cytopoptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, compressent sequence is that of a nucleic acid sequence of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO cert for wire intimity in the printed in electronic format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                       development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip. wipo.int/pub/publishedpct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ADI52147 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     primer; PCR; gene chip; antisense; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease. in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, september sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO as for wino intention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 17-SEP-2002; 2002WO-IB004523

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 2250
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cc in the phenomena of tumour suppression, tumour reversion, apoptosis cc and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, comotropic or neuroleptic activity. The DNA sequences may be useful as cytobes and primers for detecting, indentifying, quantifying and/or camplifying nucleic acid, for example as one component of a gene chip, in cylifto as antisense reagents and for production of recombinant cylifto as antisense reagents and for production of recombinant cylifto as antisense reagents and for production of recombinant cylifto as antisense reagents and for production of recombinant completides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that care characterised by development of tumours or cell degeneration.

C specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention.

C Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 2251
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to novel isolated nucleic acid sequences involved in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cycostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of polypeptides. The invention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the printed specification, but was obtained in electronic format directly from WIPO at figure in the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at figure in the publishedpct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

in the phenomena of tumour suppression, tumour reversion, apoptosis This invention relates to novel isolated nucleic acid sequences involved

in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of polypeptides. The invention may therefore be useful for preparation of polypeptides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                          New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                          WPI; 2003-313354/30.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cytostatic; virucide; neuroprotective; nootropic; neuroleptic; probe; primer; PCR; gene chip; antisense; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ds; hu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                             in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, i vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid, useful with tumors and cell degeneration, and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cytostatic; virucide; neuroprotective; nootropic; neuroleptic; primer; PCR; gene chip; antisense; viral disease; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human tumour suppression/reversion-related DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADI47513 standard; DNA; 17
                                                                                  specifically cancer but also Alzheimer's disease and schizophrenia present sequence is that of a nucleic acid sequence of the inventior Note: The sequence data for this patent did not form part of the prispecification, but was obtained in electronic format directly from w
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 17-SEP-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  15-APR-2004

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                              This invention relates to novel isolated nucleic acid sequences involved component of tumour suppression, tumour reversion, apoptosis cand/or resistance to viruses. The invention may be useful for the compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as crosses and primers for detecting, indentifying, quantifying and/or camplifying nucleic acid, for example as one component of a gene chip, in component conditions and component of a gene chip, in component conditions are characterised by development of tumours or cell degeneration, considered by a nucleic acid sequence of the invention. The green the sequence of atta for this patent did not form part of the printed confidence is that of a nucleic acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to identifying an eRNA or a DNA sequence comprising an eRNA-encoding sequence in the nucleome of a eukaryotic cell comprises identifying non-protein-encoding nucleotide sequences within an mRNA transcript or a DNA sequence encoding same in the nucleome. The methods are useful for identifying an eRNA or DNA for modifying a genetic network in cell to alter the cells phenotype. The present sequence represents a putative eRNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ds; eRNA.

The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid sequences associated with tumor suppression, apoptosis or virus resistance are useful to diagnose and treat disease, development of tumor cells and cell degeneration.

         New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents an isolated nucleic acid sequence associated with tumour suppression or regression, apoptosis or virus resistance invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 17

The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid sequences associated with tumor suppression,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises nucleic acids (e.g. antisense oligonucleotides)

CC that down regulate the expression or inhibit the function of a receptor

CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),

CC IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the

CC invention are useful for treating: cerebrovascular accident, central

CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,

CC ymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,

CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune

CC disease, lupus, multiple sclerosis, transplant/graft rejection,

CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

CC culatic acids of the invention are also useful for down-regulating the

CC drifts and mutations within diseased cells or to detect the presence of a

CC culativate remuesce
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                           ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises nucleic acids (e.g. antisense oligonucleotides)

that down regulate the expression or inhibit the function of a receptor

for a neurite growth inhibitor, NGGO, prostaglandin Dz receptor (FTGDR),

KappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the

invention are useful for treating: cerebrovascular accident, central

cervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,

lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,

restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune

disease, lupus, multiple sclerosis, transplant/graft rejection,

ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic

conditions (e.g. asthma, allergic rhintis or atopic dermatitis). The

nucleic acids of the invention are also useful for down-regulating the

expression of a target gene and as a diagnostic tool to examine genetic

drifts and mutations within diseased cells or to detect the presence of a
                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                      CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC restenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis), The
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis) The
CC conditions of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC cunstrare securence

                                                                                                                                                                                                                                                                                                         RESULT 2268
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cucleic acids of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a CC cucleic acids of a coll. that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PMCDR), (I RappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the cinvention are useful for treating; cerebrovascular accident, central crimery on the cerebrovascular accident, central crimery on the control injury, cancer (e.g. melanoma, I restenosis or asthma), crohn's disease (e.g. rheumatoid arthritis, cristenosis or asthma), crohn's disease, diabetes, obesity, autoimmune clientaese, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the capression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a carget RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rej graft rejection; ischaemia; reperfusion; glomerulonephritis; allergy; asthma; allergic rhinitis; atopic dermatitis; human

                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises nucleic acids (e.g. antisense oligonucleotides)

C that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obssity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhintits or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target many cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the presence of a crifts and mutations within diseased cells or to detect the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NGG, protaglandin D2 receptor (PTGDR), in the protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR), for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR), invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, nulliple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of the conditions within diseased cells or to detect the presence of the presence of the conditions within diseased cells or to detect the presence of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 03-APR-2002; 2002WO-US010512

                                                                                                                                                                                                                                                                                                                   δ
                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises nucleic acids (e.g. antisense oligonucleotides)

Chat down regulate the expression or inhibit the function of a receptor (PTGDR),

Compared to the function of a receptor (PTGDR),

Compared to the function of a receptor (PTGDR),

Compared to the function are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, crestenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection,

Compression of asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target rans assumence.
                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                       Best
                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NGG, prostaglandin D2 receptor (PTGDR), I klapse kinase (IKK), or protein kinase PKR. The nucleic acide of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or giloma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKX), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC current of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a crayet RNA in a cell. The present RNA sequence represents a human PKR constrains can be considered to the constant of the constant

The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NGG, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, edisease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the
                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               05-APR-2001; 2001US-00827395

The invention relates to a novel isolated NOVX polypeptide. The CC polypeptide of the invention demonstrates antidiabetic, anorectic, CC cardiant, hypotensive, antiarteriosclerotic, anorectic, virucide, CC antibacterial, fungicide, protozoacide, nootropic, neuroprotective, CC antiparkinsonian, anticonvulsant, osteopathic, antiarthritic, CC antiinflammatory, dermatological, antiasthmatic and antilipaemic CC activities. The polypeptides, nucleic acid molecules and antibodies may CC be useful in the manufacture of a medicament for treating metabolic CC disorders, diabetes, obesity, infectious diseases (viral, bacterial, CC disorders, diabetes, obesity, infectious diseases (viral, bacterial, CC disorders, and protozoal), anorexia, cancer, cardiovascular CC disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune CC disorders such as osteoarthritis, haemopoietic disorders, inflammatory skin disorders, asthma and various types of dyslipidaemia. The nucleic CC acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit neurogenesis, cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 31-MAY-2002; 2002US-038321IP.

                                                                                 The invention relates to diagnosing a predisposition to fat deposition leanness in a subject comprising detecting the presence or absence of polymorphic variation associated with fat deposition at a polymorphic site in a PLA2GIB nucleotide sequence in a nucleic acid sample from a subject, where the presence of the polymorphic variation indicates a predisposition to fat deposition in the subject. The polymorphic variation is a guanine at position 7328 or thymine at position 9182 of the present sequence. The method is useful for diagnosing a predisposition to fat deposition or leanness in a subject, and consequently for diagnosing a predisposition to non-insulin dependent diabetes mellitus (NIDDM) in a subject and conditions such as hyperinsulhatility. Cymitography minusia which cannot dyslipidemia, hypertension, glucose intolarance, dyslipidemia,

CC neoplastic, where (1) is chosen from any one of 255 genes (glioma CC endothelial markers (GEMs)) as given in specification, and comparing the capression of (1) in (1) with expression of (1) in a second normal brain CC tissue sample (R), where increased expression of (1) in (T) relative to CC (R), identifies (T) as likely to be neoplastic. Also described: (1) cc antibody that specifically binds to a extracellular spitope; (2) cc identifying (M3) a test compound as potential anticancer or antiglioma (I), monitoring an expression product of the at least one gene and CC (I), monitoring an expression product of the at least one gene and CC identifying test compound as a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M4) a test compound as a potential anticancer or antiglioma (CC identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M4) a test compound CC identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) an immune response to glioma involves administering to a mammal, a protein (CC or (I). (I) have cytostatic activities, and can be used to trigger immune destruction of glioma cells, and as immune response inducers. (M1) is useful for aiding in diagnosing glioma. (M2) is useful for treating multication surgically removed. The present sequence represents a human GEM consider invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          fat deposition. The present invention describes methods to detect the presence or absence of these single nucleotide polymorphisms of PLAZGIB, in particular G7328A and T9182G, and subsequently provide treatment that reduces fat deposition. This treatment may consist of an appetite suppressant, a lipase inhibitor, a phospholipase inhibitor, an exercise regimen, a dietary regimen, psychological counselling, psychotherapy or psychotherapeutic. Accordingly, PLAZGIB is a target for reducing fat deposition and it can be used to treat both obesity and non-insuling deposition and it can be used to treat both obesity and non-insuling deposition and it can be used to treat both obesity and non-insuling deposition and it can be used to treat both obesity and non-insuling deposition and it can be used to treat both obesity and non-insuling deposition and it can be used to treat both obesity and non-insuling deposition and it can be used to treat both obesity and non-insuling deposition and it can be used to treat both obesity and non-insuling deposition and it can be used to treat both obesity and non-insuling deposition and it can be used to treat both obesity and non-insuling deposition and the deposi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       dependent diabetes mellitus (NIDDM), as well as cardiovascular disorders such as hypertension. As such, it exhibits antidabetic activity. This oligonucleotide sequence is a PCR primer used to amplify a region of interest (i.e. genotype SNPs) in human PLA2GIB DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel candidate therapeutic agent useful for fat reduction and disorders related to fat depositions. Specifically, it refers to polymorphic variations in the phospholipase A2 (PLA2GIB) DNA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a candidate therapeutic for fat reduction, useful treating diabetes, by introducing a test molecule to a system PLAJCHB protein or nucleic acid, and determining the presence interaction between the compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      17-JUN-2004

infarction in an individual who has at least one risk factor chosen from an at-risk haplotype for myocardial infarction, an at-risk haplotype for myocardial infarction, an at-risk haplotype in the 5-lipoxygenase activating protein (FLAP) gene, a polymorphism in a FLAP nucleic acid and an at-risk polymorphism in the 5-lipoxygenase (5-LO) gene promoter; in an individual who has at least one risk factor chosen from diabetes, hypertension, hypercholesterolaemia, elevated Ip(a), obesity, past or current smoker; in an individual having elevated inflammatory marker chosen from C-reactive protein (CRP), serum amyloid A, fibrinogen, leukotriene, leukotriene metabolite, interleukin-6, tissue necrosis factor-alpha, soluble vascular cell adhesion molecule (sVCAM), soluble intervascular adhesion molecule (sICAM), E-selectin, matrix metalloprotease type-3, matrix metalloprotease type-3, matrix metalloprotease type-9, in an individual having increased low density improtease type-9; in an individual having increased low density improtease type-1, instructions in the selection increased low density improtease type-1 in an individual having increased low density improtease type-1 in an individual having increased low density improtease type-1 in an individual having increased low density improtease type-1 in an individual having increased low density improtease type-1 in an individual having increased low density improtease type-1 in an individual having increased low density improtease type-1 in an individual having increased low density improtease type-1 in an individual having increased low density improtease type-2 in an individual having increased low density improtease type-2 in an individual having increased low density improtease type-2 in an individual having increased low density improtease type-2 in an individual having increased low density improtease type-2 in an individual having increased low density improtease type-2 in an individual having increased low density improtease type-2 in an individual having increased
individual having increased low density lipoprotein (LDL) cholesterol and/or decreased high density lipoprotein (HDL) cholesterol; in an individual having increased leukctriene synthesis; in an individual having previous myocardial infarction or acute coronary syndrome (ACS) event, stable angina; or in an individual who has atherosclerosis or who requires treatment to restore blood flow in arteries. (M1) is useful for treating an individual suffering from acute coronary syndrome chosen from unstable angina, non-ST-elevation myocardial infarction (NSTEMI) and ST-elevation myocardial infarction (STEMI). The human FLAP gene is located on chromosome 13, more specifically to 13q12. The present sequence represents a microsatellite marker used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        acute coronary syndrome; antiatherosclerotic; cardiant; antianginal leukotriene biosynthesis inhibitor; leukotriene receptor antagonist 5-lipoxygenase activating protein; FLAP; human; chromosome 13; chromosome 13q12; polymorphism; 5-lipoxygenase gene promoter; 5-LO gene promoter; diabetes; hypertension; hypercholesterolaemia; obesity; inflammatory marker; low density lipoprotein; cholesterol;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        syndrome (ACS) in an individual comprising administering (I). (I) has antiatherosclerotic, cardiant and antiathoriant activities, and can be used as a leukotriene biosynthesis inhibitor, and a leukotriene receptor antagonist. (I) can be use for the manufacture of a medicament for the treatment of myocardial infarction or susceptibility to myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of leukotriene synthesis for treatment for myocardial infarction in individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Helgadottir A,

The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of a Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human LOC338749 DNA which is located at
                                                                                                                                                                                                                                                                                                                                                                              Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     breast cancer; cytostatic; chromosome 11p15.3; ss; PCF

                                                                             Query Match
                                                                                                                              The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of a Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human LOC338749 DNA which is located at chromosomal position 11p15.3.

The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV;GPVI) DNA which is located at chromosomal position 19q13.4.
                                                    Kit for automated genotyping contg. pairs of PCR primers - designed to amplify polymorphic nucleotide repeat sequences, arranged in sets each with a characteristic fluorescence label, useful e.g. in detection of disease related genetic rearrangement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          25-NOV-2002; 2002US-0429136P.

                                                                 The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM intervals throughout the human genome which can be detectably labelled. The MMS are polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 11 primer pairs are shown in AAQ95841-82. The published size range of the D6S344 allele is 13-15 bp, and the degree of heterozygosity in the population is

Haplotype analyses for indirect detection of glaucoma

Page 28; 41pp; English.

This sequence represents a PCR primer used in the method of the invention. The method is for detecting the presence of alleles for glaucoma comprising haplotype analysis of human chromosome 2 and 6 respectively, where the haplotypes are associated with loci GLC1B and GLC6p25 respectively. The primers are used to amplify gene sequences to generate information necessary to compile haplotype profiles. The haplotype profiles can be used to detect presymptomatic and symptomatic glaucoma. They can also be used to localise, isolate and identify the GLC1B and GLC6p25 loci so that detection of individuals with glaucoma is enhanced. The haplotype analyses also provide means for identification and following of mutant alleles in pedigrees or populations.

                                                     The invention relates to a method for determining the ability of a cell to metabolise a drug. The method comprises using a detection primer complementary to a sequence 5' in relation to a point mutation of single-stranded DNA encoding a cytochrome P450 isoform, and detecting the hybridisation. Cytochrome P450 is group of enzymes located in the major route of phase I drug metabolism. The polymorphism of these enzymes results in the appearance of different phenotypes with differential capacities to metabolise drugs. The method allows for the detection of a mutation in a Cyp nucleotide sequence, where the mutation is known to affect the isoform's ability to metabolise a drug. The method is useful for measuring a patient's ability to metabolise a drug, specifically drugs which are metabolised by cytochrome P450 such as omegrazole, pentagrazole, phengytoin, verapamil, propanolol, tolbutamide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer; cytochrome P450; drug metabolism; omeprazole; pentaprazole; phenytoin; verapamil; propanolol; tolbutamide; S-warfarin; imiprami anti-malarial prodrug; proguanil; tricyclic anti-depressant; ss.
